Distribution Box: Handles main supply voltage (220V-690V) with current ranging from tens to hundreds of amps. Junction Box: Mainly for low-voltage wiring (12V-240V) . The Fuse Box is an older type of distribution panel that uses fuses instead of circuit breakers to protect electrical circuits. Each fuse is designed to blow when the current exceeds a certain limit, thereby cutting off the power to prevent damage. Although less common in modern installations, fuse. A distribution board (also known as panelboard, breaker panel, electric panel, DB board or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit breaker for each circuit in a common. A distribution box, also known as a distribution board or panel, is the central unit that distributes incoming electrical power to various circuits. The range of applications extends from pure energy distribution in buildings to building automation and through to industrial plants.
